RESEARCH OVERVIEW / VERSION 1.1.0

Beyond Matching: OTHERS and Directional Weak-Evidence Intelligence

Metric Directional Intuition (MDI) Research Extension | Theory-first publication overview

KEY IDEA

Similarity need not be determined by feature matching alone. Under a specified perspective, weak residual evidence and directional relations may help assess which structural transitions are promising, which hypotheses merit testing, and when evidence can support reusable structural growth.

WHAT THE v1.1.0 EXTENSION ADDS

Directional scoring. Euclidean cosine-based sails and metric-native goal-distance change operators, with explicit mathematical assumptions.

Pre-decisional guidance. Perspective fields that may guide attention, candidate generation, and exploration before final ranking.

OTHERS + MET integration. Residual evidence allocation, duplicate-evidence safeguards, governed scoring corrections, and baseline fallback.

Hypothesis and reputation. Low-budget discriminating tests, evidence-source reliability, counter-evidence, and context-sensitive updates.

Evidence relay and growth. Traceable hypothesis/evidence packets, independent validation, and promotion of validated residual signals into reusable features.

RESEARCH DOCUMENTS

MDI-001 Problem Definition and Research Boundaries · MDI-002 Euclidean and Metric-Native Directional Scoring · MDI-003 Perspective Fields and Pre-Decisional Guidance · MDI-004 OTHERS Residual Scoring and MET Integration · MDI-005 Lightweight Hypothesis Testing and Reputation · MDI-006 Evidence Relay, Validation and Structural Growth.

VALIDATION AND SCOPE

The extension specifies open questions, testable hypotheses, conformance expectations, and a staged validation roadmap. It does not claim completed experimental validation, deployed MET integration, or demonstrated biological neural mechanisms. A normalized distance score (1 − similarity) is not necessarily a mathematical metric.
